## 1. DRAWING INFERENCES ABOUT POPULATION PARAMETERS BASED ON SAMPLE DATA

### Aim

To draw inferences about population parameters based on the sample data.

### Sample Data

170, 172, 168, 165, 174, 177, 169, 180, 178, 175, 176, 171, 173, 167, 164, 162, 170, 175, 168, 174, 176, 169, 177, 171, 172, 168, 170, 165, 174, 179, 181, 178, 173, 167, 165, 172, 169, 170, 177, 175, 176, 171, 173, 167, 164, 162, 170, 175, 168, 174

### Steps Step 1: Input Your

#### **Sample Data**

Enter your sample data into a column in an Excel worksheet. For example, place the data in cells A1 to A50.

### **Step 2: Calculate Descriptive Statistics** Calculate the Sample Mean ( $\bar{x}$ ):

=AVERAGE(A1:A50)

Calculate the Sample Standard Deviation (s):

=STDEV.S(A1:A50)

Calculate the Sample Size (n):

=COUNT(A1:A50)

### **Step 3: Estimate Population Parameters**

#### **Calculate the Standard Error of the Mean (SE):**

The standard error is the standard deviation divided by the square root of the sample size.

=STDEV.S(A1:A50) / SQRT(COUNT(A1:A50))

Calculate the Margin of Error (E) for a 95% Confidence Interval:

**Use the CONFIDENCE.NORM function to calculate the margin of error.**

=CONFIDENCE.NORM(0.05, STDEV.S(A1:A50), COUNT(A1:A50))

E = CONFIDENCE.NORM(0.05, 5.2, 50) = 1.44 cm

#### **Calculate the Confidence Interval:**

Lower Bound: Mean - Margin of Error

=171.5 - 1.44 = 170.06 cm

Upper Bound: Mean + Margin of Error

$$=171.5 + 1.44 = 172.94 \text{ cm}$$

So, the 95% confidence interval for the average height of all adult men in the city is [170.06 cm, 172.94 cm].

To implement basic matrix operations, including addition, subtraction, multiplication, and transposition. **Output/Screenshot**

The screenshot shows a spreadsheet with the following data:

|    | A   | B | C     | D        | E | F | G | H |
|----|-----|---|-------|----------|---|---|---|---|
| 1  | 170 |   | Mean  | 171.52   |   |   |   |   |
| 2  | 172 |   | SD    | 4.730448 |   |   |   |   |
| 3  | 168 |   | Count | 50       |   |   |   |   |
| 4  | 165 |   |       |          |   |   |   |   |
| 5  | 174 |   |       |          |   |   |   |   |
| 6  | 177 |   | SE    | 0.668986 |   |   |   |   |
| 7  | 169 |   | ME    | 1.311189 |   |   |   |   |
| 8  | 180 |   |       |          |   |   |   |   |
| 9  | 178 |   | LB    | 170.2088 |   |   |   |   |
| 10 | 175 |   | UB    | 172.8312 |   |   |   |   |
| 11 | 176 |   |       |          |   |   |   |   |

### **Conclusion**

Based on the sample data, you can infer that the average height of adult men in the city is approximately 171.5 cm, with a 95% confidence interval ranging from 170.06 cm to 172.94 cm. This means you can be 95% confident that the true average height of all adult men in the city falls within this interval.

## 2. PREDICTING A CONTINUOUS OUTCOME VARIABLE FROM ONE OR MORE PREDICTOR VARIABLES PREDICTION USING REGRESSION

### Aim

Let's predict a student's final exam score (outcome variable) based on their study hours and attendance percentage (predictor variables). Study hours=7, Attendance Percentage=85%.

### Sample Data

| Student | Study Hours (X1) | Attendance (%) (X2) | Final Exam Score (Y) |
|---------|------------------|---------------------|----------------------|
| 1       | 5                | 80                  | 76                   |
| 2       | 3                | 60                  | 58                   |
| 3       | 8                | 90                  | 88                   |
| 4       | 6                | 85                  | 82                   |
| 5       | 4                | 70                  | 72                   |
| 6       | 7                | 75                  | 80                   |
| 7       | 5                | 65                  | 70                   |
| 8       | 2                | 50                  | 55                   |
| 9       | 9                | 95                  | 92                   |
| 10      | 6                | 80                  | 78                   |

### Steps

#### Step 1: Input Data

Input your data into an Excel worksheet as shown in the table above.

#### Step 2: Load Analysis Tool Pack Step

#### 3: Perform Regression Analysis

1. Go to the Data tab on the Ribbon.
2. Click on Data Analysis in the Analysis group.
3. Select Regression and click OK.

#### Step 4: Set Up Regression Parameters

1. Input Y Range: Select the range containing the outcome variable (Final Exam Score). For example, if your data is in columns, select \$D\$2:\$D\$11.
2. Input X Range: Select the range containing the predictor variables (Study Hours and Attendance). For example, select \$B\$2:\$C\$11.
3. Labels: If you have column labels, check the Labels box.
4. Output Range: Select a location for the output. For example, \$F\$1.
5. Click OK.

Suppose the output is:

|  | Coefficients | Standard Error | t Stat | P-value |
|--|--------------|----------------|--------|---------|
|--|--------------|----------------|--------|---------|

|              |      |      |     |        |
|--------------|------|------|-----|--------|
| Intercept    | 20.5 | 4.1  | 5.0 | 0.0002 |
| Study Hours  | 5.2  | 0.8  | 6.5 | 0.0001 |
| Attendance % | 0.3  | 0.05 | 6.0 | 0.0001 |

From this output:

- The regression equation is: Final Exam Score = 20.5 + 5.2\*(Study Hours) + 0.3\*(Attendance %)
- Both predictor variables (Study Hours and Attendance %) are statistically significant (P-values < 0.05).
- For every additional hour of study, the final exam score increases by 5.2 points.
- For every additional percentage point of attendance, the final exam score increases by 0.3 points.

### Output/Screenshot

|    | A       | B           | C              | D          | E | F                     | G        | H        | I        | J        | K              | L | M | N | O |
|----|---------|-------------|----------------|------------|---|-----------------------|----------|----------|----------|----------|----------------|---|---|---|---|
| 1  | Student | Study Hours | Attendance (%) | Final Exam |   |                       |          |          |          |          |                |   |   |   |   |
| 2  | 1       | 5           | 80             | 76         |   | SUMMARY OUTPUT        |          |          |          |          |                |   |   |   |   |
| 3  | 2       | 3           | 60             | 58         |   |                       |          |          |          |          |                |   |   |   |   |
| 4  | 3       | 8           | 90             | 88         |   | Regression Statistics |          |          |          |          |                |   |   |   |   |
| 5  | 4       | 6           | 85             | 82         |   | Multiple R            | 0.988552 |          |          |          |                |   |   |   |   |
| 6  | 5       | 4           | 70             | 72         |   | R Square              | 0.977236 |          |          |          |                |   |   |   |   |
| 7  | 6       | 7           | 75             | 80         |   | Adjusted R            | 0.970731 |          |          |          |                |   |   |   |   |
| 8  | 7       | 5           | 65             | 70         |   | Standard E            | 2.028185 |          |          |          |                |   |   |   |   |
| 9  | 8       | 2           | 50             | 55         |   | Observations          | 10       |          |          |          |                |   |   |   |   |
| 10 | 9       | 9           | 95             | 92         |   |                       |          |          |          |          |                |   |   |   |   |
| 11 | 10      | 6           | 80             | 78         |   | ANOVA                 |          |          |          |          |                |   |   |   |   |
| 12 |         |             |                |            |   |                       | df       | SS       | MS       | F        | Significance F |   |   |   |   |
| 13 |         |             |                |            |   | Regression            | 2        | 1236.105 | 618.0526 | 150.2486 | 1.78E-06       |   |   |   |   |
| 14 |         |             |                |            |   | Residual              | 7        | 28.79474 | 4.113534 |          |                |   |   |   |   |
| 15 |         |             |                |            |   | Total                 | 9        | 1264.9   |          |          |                |   |   |   |   |
| 16 |         |             |                |            |   |                       |          |          |          |          |                |   |   |   |   |
| 17 |         |             |                |            |   |                       |          |          |          |          |                |   |   |   |   |
| 18 |         |             |                |            |   |                       |          |          |          |          |                |   |   |   |   |
| 19 |         |             |                |            |   |                       |          |          |          |          |                |   |   |   |   |
| 20 |         |             |                |            |   |                       |          |          |          |          |                |   |   |   |   |
| 21 |         |             |                |            |   |                       |          |          |          |          |                |   |   |   |   |

### Conclusion

If a student studies for 7 hours and has an attendance of 85%, their predicted final exam score is:

$$= 20.5 + 5.2*7 + 0.3*85 = 77.7$$

### 3. ASSESS THE RELATIONSHIP BETWEEN VARIABLE USING KARL PEARSON COEFFICIENT

#### Aim

To assess the relationship between variable using Karl Pearson Coefficient

#### Sample Data

| subject | age x | glucose level y |
|---------|-------|-----------------|
| 1       | 43    | 99              |
| 2       | 21    | 65              |
| 3       | 25    | 79              |
| 4       | 42    | 75              |
| 5       | 57    | 87              |
| 6       | 59    | 81              |

#### Steps

##### Step 1: Input Data

Input your data into an Excel worksheet as shown in the table above.

##### Step 2: Load Analysis Tool Pack

##### Step 3: Perform Correlation

Go to the Data tab on the Ribbon.

Click on Data Analysis in the Analysis group. Select correlation and click OK.

##### Step 4: Set Up Correlation Parameters

Input Range: Select the range containing the inputs

Labels: If you have column labels, check the Labels box.

Output Range: Select a location for the output. For example, \$F\$1. Click OK.

The range of the correlation coefficient is from -1 to 1. Our result is 0.5298 or 52.98%, which means the variables have a moderate positive correlation.

#### **Expected output**

|                        | <i>subject</i> | <i>age x</i> | <i>glucose level y</i> |
|------------------------|----------------|--------------|------------------------|
| <i>subject</i>         | 1              |              |                        |
| <i>age x</i>           | 0.695581648    | 1            |                        |
| <i>glucose level y</i> | -0.130664344   | 0.529808902  | 1                      |

**Output/Screenshot**

|   | A       | B     | C               | D | E           | F        | G        | H             | I |

| 4 | 3       | 25    | 79              |   | glucose lev | -0.13066 | 0.529809 | 1             |   |
| 5 | 4       | 42    | 75              |   |             |          |          |               |   |
| 6 | 5       | 57    | 87              |   |             |          |          |               |   |
| 7 | 6       | 59    | 81              |   |             |          |          |               |   |
| 8 |         |       |                 |   |             |          |          |               |   |

**Conclusion**

Since correlation (0.5298) is greater than 0. It means we have positive correlation. The range of the correlation coefficient is from -1 to 1.

#### 4. ASSESS OF DIFFERENCES BETWEEN GROUPS AND DRAW CONCLUSIONS ABOUT POTENTIAL FACTORS INFLUENCING THE OBSERVED PATTERNS

##### Aim

Set up an analysis of variance of table for the following two-way design results. Also state whether variety differences are significant at 5% level.

##### Sample Data

| variety of fertilizers/variety of seeds | wheat A | wheat B | wheat C |
|---|---------|---------|---------|
| w                                       | 6       | 5       | 5       |
| x                                       | 7       | 5       | 4       |
| y                                       | 3       | 3       | 3       |
| z                                       | 8       | 7       | 4       |

Does the variety of fertilizers significantly affect the yield?

Does the variety of seeds significantly affect the yield?

Is there an interaction between the variety of fertilizers and the variety of seeds that significantly affects the yield?

##### Steps

##### **Step 1: Input Data**

Input your data into an Excel worksheet as shown in the table above.

##### **Step 2: Load Analysis Tool Pack**

Click “ANOVA Two Factor Without Replication” and then click

“OK.” The two way ANOVA window will open. **Step 3: Type an Input**

**Range into the Input Range box.**

A1 to A25, type “A1:A25” into the Input Range box. Make sure you include all of your data, including headers and group names.

##### **Step 4: Select an Output Range.**

**Step 5: Select an alpha level. In most cases, an alpha level of 0.05 (5 percent) works for most tests.**

**Step 6: Click “OK” to run the two-way ANOVA.**

##### **Step 7: Read the results.**

To figure out if you are going to reject the null hypothesis or not, you’ll basically be looking at two factors:

- If the F-value (F) is larger than the f critical value (F crit).
- If the p-value is smaller than your chosen alpha level.

**Output/Screenshot**

|    | A                                       | B       | C       | D       | E | F                                     | G     | H   | I        | J        | K        | L        |  |  |
|----|---|---------|---------|---------|---|---------------------------------------|-------|-----|----------|----------|----------|----------|--|--|
| 1  | variety of fertilizers/variety of seeds | wheat A | wheat B | wheat C |   | Anova: Two-Factor Without Replication |       |     |          |          |          |          |  |  |

| 12 |   |         |         |         |   |                                       |       |     |          |          |          |          |  |  |
| 13 |   |         |         |         |   |                                       |       |     |          |          |          |          |  |  |
| 14 |   |         |         |         |   | ANOVA                                 |       |     |          |          |          |          |  |  |
| 15 |   |         |         |         |   | Source of Variation                   | SS    | df  | MS       | F        | P-value  | F crit   |  |  |
| 16 |   |         |         |         |   | Rows                                  | 18    | 3   | 6        | 6        | 0.030796 | 4.757063 |  |  |
| 17 |   |         |         |         |   | Columns                               | 8     | 2   | 4        | 4        | 0.078717 | 5.143253 |  |  |
| 18 |   |         |         |         |   | Error                                 | 6     | 6   | 1        |          |          |          |  |  |
| 19 |   |         |         |         |   |                                       |       |     |          |          |          |          |  |  |
| 20 |   |         |         |         |   | Total                                 | 32    | 11  |          |          |          |          |  |  |
| 21 |   |         |         |         |   |                                       |       |     |          |          |          |          |  |  |

**Conclusion**

- The P-value (0.0308) is less than the significance level of 0.05. This indicates that the differences between the fertilizer varieties are statistically significant at the 5% level.
- Since the F-ratio (6) is greater than the F critical value (4.7571), we reject the null hypothesis, meaning there is a significant effect of fertilizer variety on the yield.
- The variety of seeds does not have a statistically significant as P-value (0.078717) is greater than the significance level of 0.05. This indicates that changing the seed variety does not lead to significant differences in yield within this dataset.

## 5. ANALYSING CATEGORICAL DATA AND ASSESSING RELATIONSHIPS BETWEEN VARIABLES (CHI-SQUARE)

### Aim

Let's Analysing categorical data and assessing relationships between variables (Chi-Square).

### Sample Data

|             | 18-29 | 30-49 | 50+ |
|-------------|-------|-------|-----|
| Satisfied   | 45    | 30    | 25  |
| Neutral     | 35    | 40    | 25  |
| Unsatisfied | 20    | 30    | 50  |

### Steps

**Step 1: Input Data** Input your data into an Excel worksheet as shown in the table above.

### **Step 2: Calculate Expected Frequencies 1.**

#### **Observed Frequencies:**

- Place the observed frequencies in a table (e.g., starting from A1).

#### **2. Row and Column Totals:**

- Calculate the row totals:
  1. Example for "Satisfied" row:
  2. **=SUM(B2:D2)**
  3. Repeat for other rows.
- Calculate the column totals:
  1. Example for "18-29" column:
  2. **=SUM(B2:B4)**
  3. Repeat for other columns.

#### **3. Grand Total:**

- Calculate the sum of all observations: ○ **=SUM(B2:D4)** (if your observed frequency table is from B2).

#### **4. Expected Frequencies:**

- Create a new table for expected frequencies. ○ For each cell, use the formula: ○ **= (Row Total \* Column Total) / Grand Total**
- Example for cell "Satisfied and 18-29":
- **= (B5 \* E2) / E5** ○ Replace with your corresponding cell references.

### **Step 3: Calculate Chi-Square Statistic**

**1. Chi-Square Formula:**

- For each cell, calculate:  
= **(Observed - Expected)^2 / Expected**
- Example for the first cell:  
= **(B2 - B7)^2 / B7**  
Replace with your observed and expected cell references.

- 2. Sum Chi-Square Values:** ○ Add up all the Chi-Square values to get the Chi-Square statistic:  
=SUM(B10:D12)  
(Assuming your Chi-Square values are in B10.)

**3. Degrees of Freedom:**

- Calculate degrees of freedom using the formula: = **(Number of Rows - 1) \* (Number of Columns - 1)** Example: For a 3x3 table:  
= **(3 - 1) \* (3 - 1)**  
Result: 4 degrees of freedom.

**4. P-Value:**

- Use the CHISQ.DIST.RT function to calculate the p-value: =CHISQ.DIST.RT(**Chi-Square Statistic, Degrees of Freedom**)

**Step 4: Interpretation**

- 1. Compare P-Value to Significance Level:** ○ If the **p-value < 0.05**, reject the null hypothesis.  
This indicates a **significant relationship** between the variables.
- If the **p-value ≥ 0.05**, fail to reject the null hypothesis. This indicates **no significant relationship**.

**Output/Screenshot**

|    | A           | B     | C     | D   | E   | F | G                          | H            | I           | J |
|----|-------------|-------|-------|-----|-----|---|----------------------------|--------------|-------------|---|
| 1  |             | 18-29 | 30-49 | 50+ |     |   |                            |              |             |   |
| 2  | Satisfied   | 45    | 30    | 25  | 100 |   | 4.083333333                | 0.333333333  | 2.083333333 |   |
| 3  | Neutral     | 35    | 40    | 25  | 100 |   | 0.083333333                | 1.333333333  | 2.083333333 |   |
| 4  | Unsatisfied | 20    | 30    | 50  | 100 |   | 5.333333333                | 0.333333333  | 8.333333333 |   |
| 5  |             | 100   | 100   | 100 | 300 |   |                            |              |             |   |
| 6  |             |       |       |     |     |   | Expected Frequency         | 33.33333333  |             |   |
| 7  |             |       |       |     |     |   | Total Chi-Square Statistic | 24           |             |   |
| 8  |             |       |       |     |     |   | P-Value                    | 0.0000798748 |             |   |
| 9  |             |       |       |     |     |   |                            |              |             |   |
| 10 |             |       |       |     |     |   |                            |              |             |   |

### **Conclusion**

Since the **p-value is very small (less than 0.05)**, you reject the null hypothesis. This suggests that there is a statistically significant relationship between **Customer Satisfaction** and **Age Group**.

## 6. VISUALIZING THE DATA USING R

### Aim

To **visualize** car sales data using two different types of graphical representations:

1. **Bar Chart:** To display the sales amount for the first 10 car models in the dataset.

2. **Heatmap:** To visualize the relationship between two categorical variables (likely car-related attributes) for the first 30 entries, using a heatmap to show the frequency of occurrences. **Sample**

Load the CSV file

### Steps

#### Step 1: Open RStudio

#### Step 2: Enter the code below #

Load necessary libraries

```
library(ggplot2)
```

```
library(reshape2)
```

# Load the dataset (adjust the path if needed)

```
car_sales <- read.csv("C:/Users/abhim/Documents/car_sales.csv")
```

# View the first few rows to verify head(car\_sales,  
10)

# Bar chart for the first 10 values

```
bar_chart <- ggplot(car_sales[1:10, ], aes(x = factor(Model), y = Sales_in_thousands)) +  
geom_col(fill = "skyblue", color = "red", width = 0.7) + theme_minimal() +
```

```
labs(title = "Bar Chart – 24MCAD10", x = "Car Model", y = "Sales Amount (in thousands)")
```

```
+ theme(axis.text.x = element_text(angle = 45, hjust = 1, vjust = 1)) +
```

```
scale_y_continuous(labels = scales::comma) + scale_x_discrete(guide = guide_axis(n.dodge =  
2))
```

```
# Print the bar chart print(bar_chart)

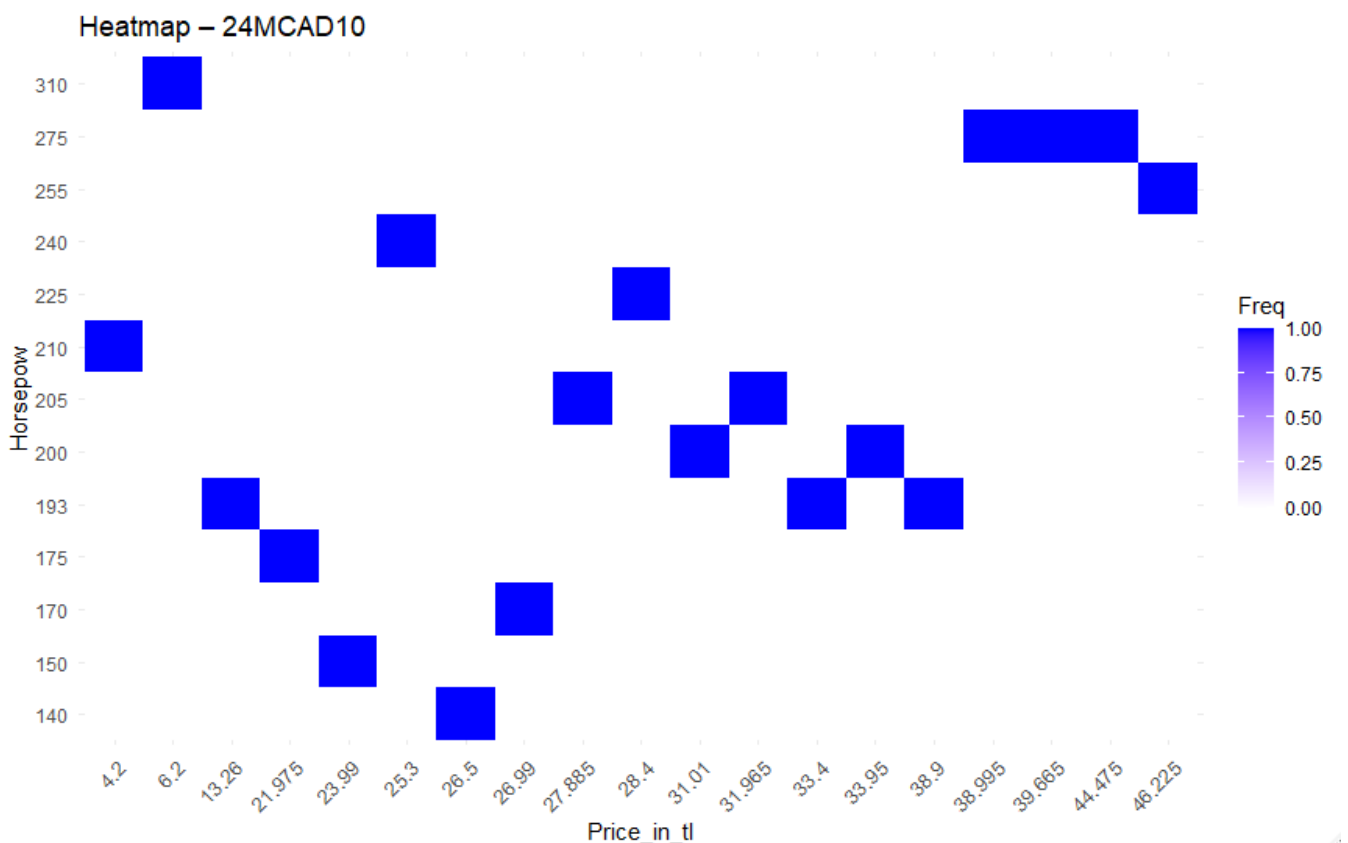

# Heatmap for the first 30 values col6 <- colnames(car_sales)[6]
# Assuming column 6 for heatmap col8 <- colnames(car_sales)[8]
# Assuming column 8 for heatmap data <- car_sales[1:30, ]

heatmap_data <- as.data.frame(table(data[[col6]], data[[col8]])) heatmap_data$Freq
<- as.integer(heatmap_data$Freq)

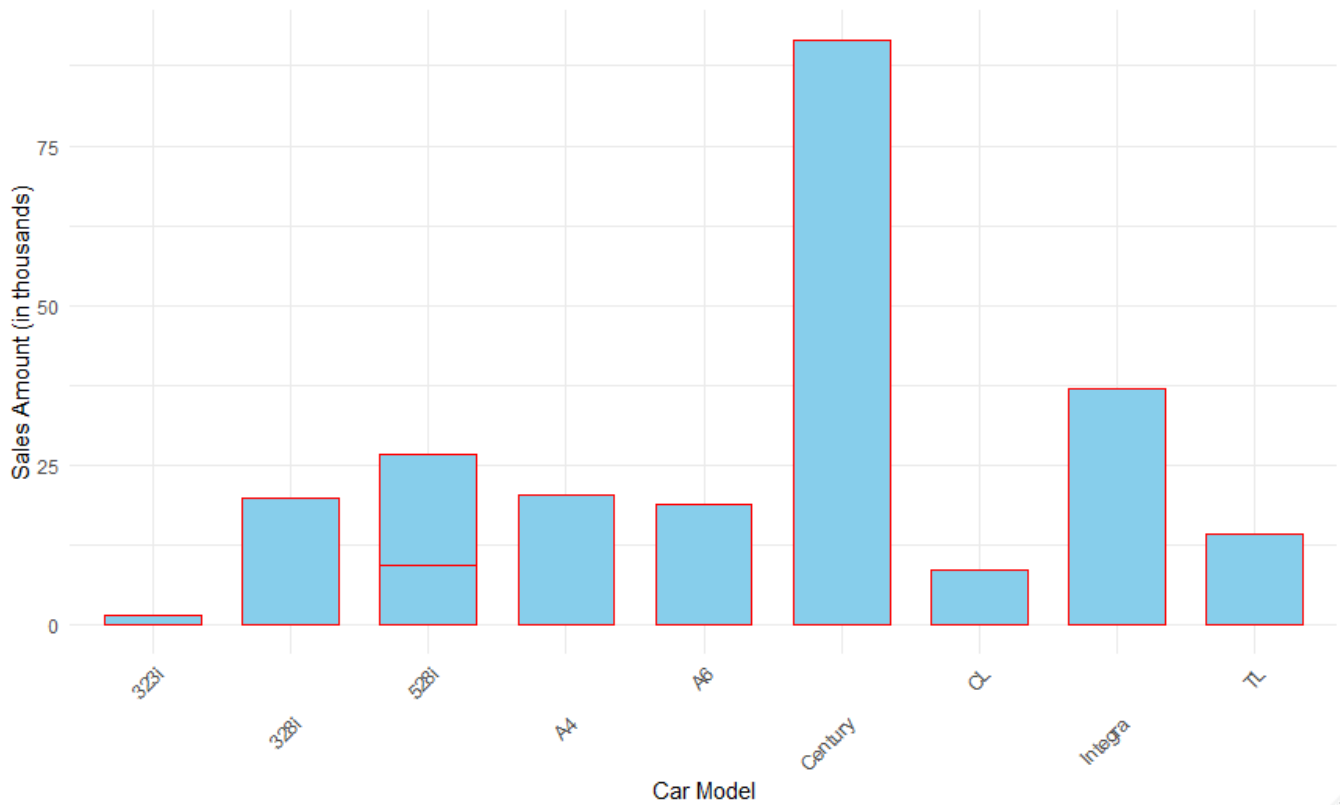

heatmap <- ggplot(heatmap_data, aes(x = Var1, y = Var2, fill = Freq)) +
  geom_tile() + labs(title = "Heatmap – 24MCAD10", x = col6, y =
col8) + scale_fill_gradient(low = "white", high = "blue") +
  theme_minimal() +
  theme(axis.text.x = element_text(angle = 45, hjust = 1, size = 10))

# Print the heatmap
print(heatmap)
```

### Output/Screenshot

Bar Chart – 24MCAD10

### **Conclusion**

Based on the sample data, the bar chart shows that the car sales for different models vary significantly, with some models having much higher sales than others. This visualization provides a clear comparison of sales performance among the top 10 car models, helping to identify which models are performing better in the market.

## 7. USE GRAPHICAL REPRESENTATIONS IN R, SUCH AS HISTOGRAMS, BOXPLOTS, AND FREQUENCY DISTRIBUTIONS, TO IDENTIFY PATTERNS AND OUTLIERS IN A DATASET

### Aim

To explore a dataset using graphical representations like scatter plots, histograms, and heatmaps to identify patterns, outliers, and relationships between car model sales and other numerical features.

### Sample Data

Histogram\n") cat("3 ----> Heatmap\n")
plot_type <- readline("Enter the chart type: ")
print(create_plot(plot_type))
}
```

### Output/Screenshot

## **Conclusion**

Graphical tools like scatter plots, histograms, and heatmaps help identify patterns and outliers in the dataset. The scatter plot highlights extreme values, the histogram shows the sales distribution with outlier thresholds, and the heatmap visualizes variable interactions. These visualizations are crucial for detecting anomalies and guiding further analysis.

## 8. PROGRAM TO TYPE SET THE MATHEMATICAL FORMULAS (LaTeX)

### Aim

To type set various mathematical formulas using LaTeX, demonstrating the use of square roots, exponents, summations, limits, and matrix representations.

### Sample Data

$$\sqrt{x} \leftrightarrow x^{1/2} \quad \sqrt[3]{2}\sqrt{x^2 + \sqrt{y}} \quad \sqrt{x^2 + y^2}$$

$$p_{ij}^3 \quad m_{kmuth} \quad \sum_{k=1}^3 k \quad a^x + y \neq a^{x+y} \quad c^{x^2} \neq e^{x^2}$$

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{1}{k^2} = \frac{\pi^2}{6}$$

### Steps

#### Step 1: Set up the LaTeX environment

Ensure that your LaTeX editor supports mathematical packages.

#### Step 2: Start the LaTeX document

```
\documentclass{report}
\usepackage{amsmath} \begin{document}

\textbf{Sona Sara Shibu 23MDTS50} \\

% Matrix notation
\begin{equation*} \begin{bmatrix}
p_{11} & p_{12} & \ldots & p_{1n} \\
p_{21} & p_{22} & \ldots & p_{2n} \\
p_{31} & p_{32} & \ldots & p_{3n} \\
\vdots & \vdots & \ddots & \vdots \\
p_{m1} & p_{m2} & \ldots & p_{mm}
\end{bmatrix} \end{equation*}

% Square roots, exponents, and some basic math operations
\sqrt{x} \leftrightharpoons x^{1/2} \quad
\sqrt[3]{2} \sqrt{x^2 + \sqrt{y}} \quad
\sqrt{x^2 + y^2}

% Exponents and Summations
p_{ij}^3 \quad m_{kmuth} \quad
\sum_{k=1}^3 k \quad
a^x + y \neq a^{x+y} \quad c^{x^2} \neq e^{x^2}
```

% Limit and Summation

```
\lim_{n \to \infty} \sum_{k=1}^n \frac{1}{k^2} = \frac{\pi^2}{6} \$ \\
\end{document}
```

### Output/Screenshot

**Krishna Bantola D 24MCAD10**

$$\begin{bmatrix} p_{11} & p_{12} & \cdots & p_{1n} \\ p_{21} & p_{22} & \cdots & p_{2n} \\ p_{31} & p_{32} & \cdots & p_{3n} \\ \vdots & \vdots & \ddots & \vdots \\ p_{m1} & p_{m2} & \cdots & p_{mm} \end{bmatrix}$$

$$\sqrt{x} \leftrightarrow x^{1/2} \quad \sqrt[3]{2} \quad \sqrt{x^2 + \sqrt{y}} \quad \sqrt{x^2 + y^2}$$

$$p_{ij}^3 \quad m_{km} \text{math} \quad \sum_{k=1}^3 k \quad a^x + y \neq a^{x+y} \quad c^{x^2} \neq (e^x)^2$$

$$\lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{1}{k^2} = \frac{\pi^2}{6}$$

### Conclusion

We can easily typeset complex mathematical formulas, including square roots, sums, limits, and matrices. This ensures that the document is both readable and precise, especially when dealing with intricate mathematical notations.

## 9. PROGRAM TO TYPE SET A CHAPTER

### Aim

To typeset a chapter using LaTeX, including various formatting features such as text formatting, ordered and unordered lists, tables, images, and special formatting commands.

### Sample Data

#### Chapter 1

### Introduction to research methodology

Methodology is the systematic, theoretical analysis of the methods applied to a field of study. It comprises the theoretical analysis of the body of methods and principles associated with a branch of knowledge. Typically, it encompasses concepts such as paradigm, theoretical model, phases and quantitative or qualitative techniques.

#### 1.1 what is research?

The systematic investigation<sup>1</sup> into and study of materials and sources in order to establish facts and reach new conclusions.

| name  | mark1 | mark2 | mark3 | mark4 | mark5 |
|-------|-------|-------|-------|-------|-------|
| sound | 86    | 87    | 89    | 90    | 78    |
| jan   | 90    | 78    | 89    | 89    | 98    |

<sup>1</sup>research

### Steps

#### Step 1: Set up the LaTeX environment

Ensure that your LaTeX editor supports mathematical packages.

#### Step 2: Start the LaTeX document

```
\documentclass{report}
\usepackage{graphicx}
\begin{document}
\chapter{Introduction to research methodology}
```

Methodology is the systematic, theoretical analysis of the methods applied to a field of study. It comprises the theoretical analysis of the body of methods and principles associated with a branch of knowledge. Typically, it encompasses concepts such as paradigm, theoretical model, phases and quantitative or qualitative techniques.

```
\section{what is research?}
```

The systematic investigation into and study of materials and sources in order to establish facts and reach new conclusions. \\

```
\begin{tabular}[center]{|c|c|c|c|c|c|}

```

```
\item The number starts at 1 with every call to the enumerate
```

```
\end{enumerate}
```

```
\end{document}
```

**Output/Screenshot**

## Chapter 1

# Introduction to research methodology

Methodology is the systematic, theoretical analysis of the methods applied to a field of study. It comprises the theoretical analysis of the body of methods and principles associated with a branch of knowledge. Typically, it encompasses concepts such as paradigm, theoretical model, phases and quantitative or qualitative techniques.

### 1.1 what is research?

The systematic investigation into and study of materials and sources in order to establish facts and reach new conclusions.

| name  | mark1 | mark2 | mark3 | mark4 | mark5 |
|-------|-------|-------|-------|-------|-------|
| sound | 86    | 87    | 89    | 90    | 78    |
| jan   | 90    | 78    | 89    | 89    | 98    |

### 1.2 unordered list

- The Individual Entries are indicate with a black dot, a so- called bullet.
- The text in the entries may be of any length.

### 1.3 ordered lists

1. The lable consist of sequential number
2. The number starts at 1 with every call to the enumerate

**Conclusion**

This LaTeX code demonstrates how to structure text, tables, images, and lists using commands like `\chapter`, `\section`, `\begin{itemize}`, and `\begin{enumerate}`. The `\includegraphics` command embeds

images, while the tabular environment creates tables, making LaTeX an effective tool for typesetting academic documents with complex formatting.

## 10. PROGRAM TO TYPE SET REFERENCES

### Aim

To typeset a research paper with in-text citations and references using LaTeX.

### Sample Data

my review Paper is published in new paper (Singh & Chatterjee, 2017).  
 another citation (Singh & Chatterjee, 2017) new one (Samarati & De Capitani di  
 Vimercati, 2016) next new one new run hello (Muttik & Barton, 2009)  
 includes references file (Nassif, Talib, Nasir, Albadani, & Dakalbab, 2021)

### References

- Muttik, I., & Barton, C. (2009). Cloud security technologies. *Information security technical report*, 14(1), 1–6.
- Nassif, A. B., Talib, M. A., Nasir, Q., Albadani, H., & Dakalbab, F. M. (2021). Machine learning for cloud security: a systematic review. *IEEE Access*, 9, 20717–20735.
- Samarati, P., & De Capitani di Vimercati, S. (2016). Cloud security: Issues and concerns. *Encyclopedia of cloud computing*, 205–219.
- Singh, A., & Chatterjee, K. (2017). Cloud security issues and challenges: A survey. *Journal of Network and Computer Applications*, 79, 88–115.

### Steps

#### Step 1: Set up the LaTeX environment

Ensure that your LaTeX editor supports mathematical packages.

#### Step 2: Start the LaTeX document

```
\documentclass{article}
```

```
\usepackage{apacite}
```

```
\begin{document}
```

Krishna Bantola D 24MCAD10 review paper is published in a new paper \cite{singh2017cloud}.  
 Another citation \cite{singh2017cloud}, new one \cite{samarati2016cloud}, next new one  
 \cite{muttik2009cloud} includes references file \cite{nassif2021machine}.

```
\bibliographystyle{apacite}
```

```
\bibliography{PGM10}
```

```
\end{document}
```

```
@article{singh2017cloud,  
  title={Cloud security issues and challenges: A survey},  
  author={Singh, Ashish and Chatterjee, Kakali},  
  journal={Journal of Network and Computer Applications},  
  volume={79}, pages={88--115},
```

```
year={2017}, publisher={Elsevier}
}
```

```
@article{samarati2016cloud,
title={Cloud security: Issues and concerns},
author={Samarati, Pierangela and De Capitani di Vimercati, Sabrina},
journal={Encyclopedia of cloud computing}, pages={205--219},
year={2016},
publisher={Wiley Online Library}
}
```

```
@article{muttik2009cloud, title={Cloud
security technologies}, author={Muttik, Igor
and Barton, Chris}, journal={Information
security technical report}, volume={14},
number={1}, pages={1--6}, year={2009},
publisher={Elsevier}
}
```

```
@article{nassif2021machine,
title={Machine learning for cloud security: a systematic review},
author={Nassif, Ali Bou and Talib, Manar Abu and Nasir, Qassim and Albadani, Halah and
Dakalbab, Fatima Mohamad},
journal={IEEE Access},
volume={9}, pages={20717--
20735}, year={2021},
publisher={IEEE}
}
```

## **Output/Screenshot**

Krishna Bantola D 24MCAD10 review paper is published in a new paper [Singh & Chatterjee(2017)]. Another citation [Singh & Chatterjee(2017)], new one [Samarati & De Capitani di Vimercati(2016)], next new one [Muttik & Barton(2009)] includes references file [Nassif *et al.*(2021)].

## **References**

- Muttik, I., & Barton, C. (2009). Cloud security technologies. *Information Security Technical Report*, 14(1), 1–6.
- Nassif, A. B., Talib, M. A., Nasir, Q., Albadani, H., & Dakalbab, F. M. (2021). Machine learning for cloud security: A systematic review. *IEEE Access*, 9, 20717–20735.
- Samarati, P., & De Capitani di Vimercati, S. (2016). Cloud security: Issues and concerns. *Encyclopedia of Cloud Computing*, 205–219.
- Singh, A., & Chatterjee, K. (2017). Cloud security issues and challenges: A survey. *Journal of Network and Computer Applications*, 79, 88–115.

## **Conclusion**

This LaTeX code demonstrates how to manage references and citations in a document by using the apacite package.

## 11. REFERENCES MANAGEMENT USING MENDELEY

### Aim

To guide users in managing references and generating citations using Mendeley, improving organization and streamlining the research process.

### Steps

#### **Step 1: Install Mendeley Desktop and Web Importer**

Download and install Mendeley Desktop from the official website.

Install the Mendeley Web Importer extension in your browser for easy reference importing.

#### **Step 2: Create a Mendeley Account and Sign In**

Sign up for a Mendeley account if you don't already have one.

Sign in to sync your references automatically across all devices.

#### **Step 3: Organize References with Folders and Tags**

Create a Folder: Go to File > New Folder, name the folder, and start organizing references. Tag

References: Add keywords (tags) to each reference for easier searching and filtering.

#### **Step 4: Add References**

You can add references in several ways:

**Web Importer:** Click the Mendeley Web Importer icon in your browser to import references directly from web pages.

**Manual Entry:** In Mendeley Desktop, click the Add New button, select a reference type (e.g., Journal Article, Book), and manually fill in the details.

**Import from Other Tools:** Go to File > Import, and upload reference files in formats such as RIS, BibTeX, or PDFs.

#### **Step 5: Attach PDFs and Annotate**

Drag and drop PDFs onto the corresponding reference entry to attach the full text. Use Mendeley's PDF viewer to highlight and annotate important sections directly in the document.

#### **Step 6: Insert In-Text Citations and Generate Bibliographies**

**Install Mendeley Cite:** Mendeley Cite is an add-in for Microsoft Word. Install it via the Tools menu in Mendeley Desktop.

**Insert Citation:** In Word, go to References > Mendeley Cite, and click Insert Citation to select a citation from your Mendeley library.

**Generate Bibliography:** After inserting citations, click Insert Bibliography in Mendeley Cite to automatically create a properly formatted bibliography in your document.

#### **Step 7: Sync Library Across Devices**

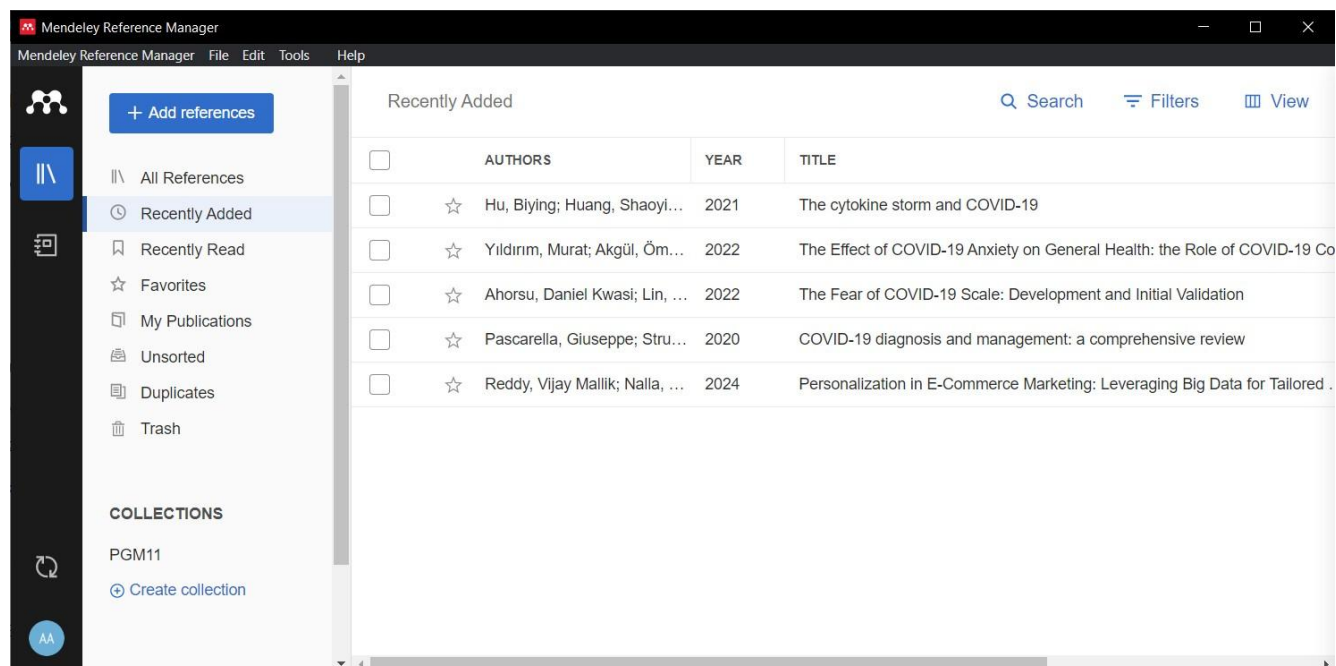

Ensure that your Mendeley library is synced across all your devices by using the Sync feature in the Mendeley Desktop or Mobile app.

### Step 8: Collaborate and Share References in Groups

Create a group by going to Groups > Create Group in Mendeley Desktop.

Invite others to your group for collaborative research and reference sharing.

### Output/Screenshot

This is Krishna Bantola D 24MCAD10 [1] testing program 11 for citation using Mendeley [2].

Another citation new one [3] next new one [4] includes references file.

## Bibliography

## References

- [1] S. Author, "The Effect of COVID-19 Anxiety on General Health: The Role of COVID-19 Coping," *International Journal of Mental Health and Addiction*, vol. 20, no. 2, p. , 2022.
- [2] M. H. Bickhard and J. C. Christopher, "The influence of early experience on personality development," *New Ideas in Psychology*, vol. 12, no. 3, pp. 229–252, 1994.
- [3] A. Author, "The cytokine storm and COVID-19," *Journal of Medical Virology*, vol. 93, no. 1, p. , 2021.
- [4] B. Author, "COVID-19 Diagnosis and Management: A Comprehensive Review," *Journal of Internal Medicine*, vol. 288, no. 2, p. , 2020.

## Conclusion

By following these steps, users can efficiently organize references, insert citations, and generate bibliographies. Mendeley helps automate citation formatting and supports collaboration, enhancing the research workflow..
